

I gained a great deal from my internship at the École Polytechnique lab. Thanks to the scholarship provided by the school, I was able to support myself while living in Paris. During the three-month internship, I stayed on campus and worked in the LPICM lab on weekdays. We had a one-week summer vacation, and on weekends, I had the chance to travel. I visited London, Belgium, Switzerland, and several major cities in France, including Lyon, Bordeaux, Strasbourg, Marseille, and Nice. Additionally, I had the incredible experience of attending the Olympic Games in person.

My research focused on Tip-Enhanced Raman Spectroscopy, with a dedicated supervisor who guided me through the experiments. I learned from my professor how to reproduce experiments from published papers, and how to effectively organize and document my work. I worked well with my professor and lab mates, and made many friends during my time there.

This experience confirmed my desire to pursue research in the future and gave me invaluable insight into the research environment in Europe. I now aspire to pursue a Master's or PhD in Europe.
